

How the servers work

It's just software. What's it doing?

- It *listens* for connections on some predetermined port
- When it receives and accepts a connection, it talks HTTP
 - Which means, it waits for the *client* to send an *HTTP request*
 - and then it sends back the appropriate *HTTP response*

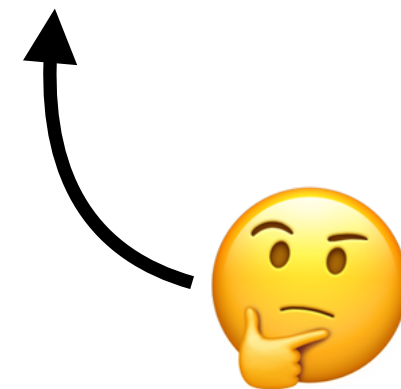

How the server works

It's just software. What's it doing?

- It *listens* for connections on some predetermined port
- When it receives and accepts a connection, it talks HTTP
 - Which means, it waits for the *client* to send an *HTTP request*
 - and then it sends back the appropriate *HTTP response*

What does an HTTP request "look like"?

GET

url

method

GET

/order/items?pending=1

request headers

Host: hyf.example.net

Accept: */*
